App store talking ginger free

Ken Ishii/Getty Images If you have an iPhone, chances are you know the App Store as well as other important apps like Mail, Messages or even Apple Maps. And like any app you're likely to spend a lot of time with, there are probably a few things you kind of hate about the Apple App Store. As Mike Beasley reported some time ago to 9to5Mac, the App Store has been around since iOS 2.0, when iOS was still called the Phone OPERATING SYSTEM. Since then, the store has undergone numerous major revamps, added countless new features and features, and become home to its 1.5 million apps. But along the way, it has received annoying quirks and neglected to deal with some usability issues. Unfortunately, a few of these errors still hang around, so Apple has a lot to fix with future versions of iOS (we'll look at you, iOS 10). Learn more about the worst things about the iOS App Store – and start thinking about how much better things would be with the solutions we hope Apple will implement in the future.

1. Bad search options and no recommendations If you want a new app or new game, but you don't know exactly what you're looking for, it can be quite difficult to find something to download. The Introductory tab in the App Store tries to solve the problem by truncitizing apps in several categories, including the best new apps, the best new games, popular apps, popular games, and a constantly rotating selection of collections (such as the best apps optimized for a new iPhone or the most festive holiday games). The situation is more interesting when you tap the Categories option in the upper left corner. You can browse through dozens of different categories, all of which have their own unique collections. Apple could make it easier to take advantage of all curated lists by pasting them into the featured main pages. After all, it knows which apps you've downloaded, so how hard would it be for the App Store to offer you smarter and more personalized recommendations for new apps that you might find interesting? Apple | Timothy A. Clary/AFP/Getty Images
2. Lack of lists of curated by other parties Wishing we could get smarter recommendations on downloadable apps, how great would it be if you could browse my favorite photographers curated app collections, magazine staff you can't put down, or a prestigious website on an interesting topic? Apple has its own curated lists and lots of them throughout the App Store. But curated lists of apps from individuals or posts that you respect can give you some insight into the apps and tools that people actually use, especially in mobile photography.
3. Frustrating search function Apple recently updated the app store search algorithm to get more accurate results when searching with a keyword. Application however, it is more difficult than it should be when: Know what it's called. Think about it: You can pretty easily find the app if you know its name (or at least part of its name). But when you are looking for an app that can perform a specific task, all bets are off. Entering a keyword usually returns hundreds of results, but there is no way to filter by free or paid apps, and no action to refine your search. The App Store displays related keywords, but it's usually of little help.
4. The app cannot be tried before buying app developers and iPhone users. This has led many developers to create free, limited versions of their paid apps or make the original download free and offer core features as an in-app purchase. But the App Store would benefit by adding a demo feature that allows you to get a trial version of the free app before buying it. The feature can also give you peace of mind if you are considering spending more than a dollar or two on the app. If there is an option to try the app and then get your money back, if you don't like it, users may be more inclined to give premium apps a chance. iPhone covers appear in the new flagship Apple Store app | Justin Sullivan/Getty Images
5. No social features Do you ever think about which apps your friends have downloaded or which apps they've added to their wish lists to download later? If so, too bad, because the App Store won't tell you. Apple could add a variety of social features to the App Store. For example, think about how much easier it would be to get your friends to try a new messaging app or photo sharing app if you could share apps directly in the App Store (not sending a link via iMessage). And think about how much easier it would be to follow the example of your app-loving best friend – who always has the best apps before anyone else has heard of them – if she could selectively share her recommendations in a list that you can browse directly from the App Store.
6. No way to find sales and promotions There are plenty of tech blogs and Twitter accounts that can alert you to great apps that have temporarily lowered the price or are even free to download for a limited time. But the App Store inexplicably doesn't offer an easy way to find these deals without relying on an outside source. In the future, Apple could add a section highlighting these limited-time deals and specialty sales – something that both app developers and iOS users would no doubt appreciate. 7. Unreliable reviews It's an issue that many users became familiar with when news broke that many of Amazon's reviews are fake: while you might oop users' reviews to find out if the app is a download time or purchase price you probably can't trust all of these reviews. Many less popular apps have only a few reviews at first, and it's depressingly depressing that some of these reviews are likely to remain for app creation (or their friends or employees). You might argue that this isn't really Apple's problem, but the App Store may require users to spend some time with the app before checking out to try to protect fake reviews. In the meantime, it's best to read real reviews on trusted blogs if you're worried about spending money or time on the app. No updates for Apple's own app Although you can update all other apps on your iPhone directly from the Updates tab in the App Store, there are never updates to apps preinstalled on your iPhone. What's that about? Because Apple fixes bugs and adds features to these apps using iOS updates. This means that while Apple Music has a simple error or straightforward feature that is easy to enable in Mail, you have to go through the long process of installing an update on your phone's operating system. In the future, Apple could introduce simple fixes to its own apps through the App Store, making them as painless to update as any other third-party app. Civilizations rose and fell. Rivers carved canyons. The stars twinkled and died. All this as we waited for iPhone 2.0 and App Store. If you were happy to upgrade to iPhone 2G 2.0 or have a recently acquired iPhone 3G, and you've upgraded to iTunes 7, you'll now have access to the App Store on either iTunes or iPhone and third-party native apps that download extravaganza can start! If you're new to third-party apps, new on iPhone and/or iTunes, or just want a little guidance before diving into the App Store, then after a break, read to go through the App Store! There are two ways to access the App Store: either on iPhone or via iTunes. Let's start with the iPhone App Store experience. With your iPhone in hand, tap the App Store icon. The user experience is very similar to using iTunes on iPhone, so if you have been an iTunes user on iPhone, the App Store feels very familiar. The page that greets you when you enter the App Store on your iPhone allows you to view added new apps and the most popular and frequently downloaded apps in What's Hot. Apps appear in a list with ratings and prices of up to 5 stars. At the bottom, you'll find tabs for featured, categories, top 25, search, and updates. Here's a screenshot of the new apps featured. You can scroll down and view over 20 new apps here. A similar view is available if you click the Hot button. Tap categories, and a list of different app categories with the number of apps in each category appears. Just tap the category to browse the list of apps in the category. Select the Top 25 tab to get a list of the top 25 apps to what your iPhone peers use. Be the first to review and evaluate the app! The Search tab displays a list of available software as you type finding music in iTunes. Once you've found the app you're looking for, just tap on the name and then you can see the price and choose it for more information and purchase. Here's an example of what you see after selecting an app from the list. More detailed information such as the name of the app, the company or the person who developed it, the number of reviews and the 1-5 star rating and price of other iPhone users. Just click on the price and confirm your purchase and your iPhone will download the app. If the app is larger than 10mb, a wifi connection is required. After all, AT&T doesn't want you to tie valuable bandwidth to their 3G network with massive downloads. After downloading, you can enjoy the app. The next time you sync with iTunes, the app will be synced with iTunes as part of backing up your iPhone. Then, if you ever need to restore your iPhone to factory settings, your app will be included when you restore from backup. Finally, there is the Updates tab, which allows you to check if there are naturally updates to the software you download. This sums it up in the App Store on your iPhone. Try it today and download some great apps! Now, let's go to the iTunes App Store, which is fully integrated with iTunes and works in practically the same way as downloading music or movies. Just click on the App Store in iTunes and you can browse all apps by category, popularity, last added and even the most popular FREE apps available for download. Browse lists of the top 10 paid apps and free apps, or see even more apps in these categories. You can quickly see the staff favorites and what is hot (popular). Click on the item of interest and get a better description, including the author of the app, price, release date, and file size. The app's details page also includes screenshots (if submitted) and customer reviews. You can get more detailed information about what others think about the app and get a better idea of whether you want to make a purchase and download it. If you click the Buy button, your iTunes account will be charged and the app will be downloaded in iTunes. Then the app will download to your iPhone when syncing. Fortunately, the App Store on both iPhone and iTunes is easy to use and full of fun and useful apps already. Check it out today and start downloading apps to iPhone – you might just be surprised how powerful your iPhone really is when the right apps are installed. Installed.
